

ME 233 Advance Control II

Lecture 2 Introduction to Probability Theory

(ME233 Class Notes pp. PR1-PR3)

Outline

- Continuous random variable
- CDF, PDF, expectation and variance
- Uniform and normal PDFs

Continuous random variable

A continuous-valued random X variable takes on a range of **real** values

- For the probability space, (Ω, \mathcal{S}, P)
- A random variable X is a mapping $X : \Omega \rightarrow \mathcal{R}$

Example:

- An experiment whose outcome is a real number, e.g. measurement of a noisy voltage.

$$X \in [V_{\min}, V_{\max}]$$

Cumulative Distribution Function

Cumulative distribution function (CDF) associated with the random variable X :

$$F_X(x) = P(X \leq x)$$

The probability that the random variable X will be less than or equal to the value x

Properties of the cumulative distribution

Probability Density Function

For a **differentiable** cumulative distribution function,

$$F_X(x) = P(X \leq x)$$

Define the **probability density function (PDF)**,

$$p_X(x) = \frac{dF_X(x)}{dx}$$

Probability Density Function

$$p_X(x) = \frac{dF_X(x)}{dx}$$

Interpretation:

$$p_X(x) \Delta x \approx P(x \leq X \leq x + \Delta x)$$

for small Δx

Loosely interpret this as the probability that X takes a value close to x

Probability Density Function

$$p_X(x) = \frac{dF_X(x)}{dx}$$

By the Fundamental Theorem of Calculus

$$\int_a^b p_X(x) dx = F_X(b) - F_X(a)$$

$$\Rightarrow \int_a^b p_X(x) dx = P(a \leq X \leq b)$$

Probability Density Function

$$\int_a^b p_X(x) dx = P(a \leq X \leq b)$$

10

Probability Density Function

Property:

$$\int_{-\infty}^{\infty} p_X(x) dx = 1$$

because

$$\int_{-\infty}^{\infty} p_X(x) dx = P(-\infty \leq X \leq \infty)$$

11

Expectation

The **expected value** of random variable X is:

$$E[X] = \int_{-\infty}^{\infty} x p_X(x) dx$$

This is the average value of X .

It is also called the **mean** of X
or the **first moment** of X

12

Expected value - notation

$$m_X = \hat{x} = E[X]$$

13

Expected value of a function

f : real valued function of random variable X

$$Y = f(X)$$

The expected value of Y is

$$E[Y] = \int_{-\infty}^{\infty} f(x) p_X(x) dx$$

14

Variance

The **variance** of random variable X is:

$$\begin{aligned}\sigma_X^2 &= E[(X - m_X)^2] \\ &= \int_{-\infty}^{\infty} (x - m_X)^2 p_X(x) dx\end{aligned}$$

where $m_X = E[X]$

σ_X is called the standard deviation of X

15

Variance

$$\sigma_X^2 = E[(X - m_X)^2]$$

$$= E[X^2] - m_X^2$$

where

$$E[X^2] = \int_{-\infty}^{\infty} x^2 p_X(x) dx$$

16

Proof

$$\begin{aligned}\sigma_X^2 &= \int_{-\infty}^{\infty} (x - m_X)^2 p_X(x) dx \\ &= \int_{-\infty}^{\infty} (x^2 - 2xm_X + m_X^2) p_X(x) dx \\ &\quad \left(\int_{-\infty}^{\infty} p_X(x) dx = 1 \right) \\ &= E[X^2] - 2m_X \underbrace{\int_{-\infty}^{\infty} xp_X(x) dx}_{m_X} + m_X^2 \\ &= E[X^2] - 2m_X^2 + m_X^2 = E[X^2] - m_X^2\end{aligned}$$

17

Uniform Distribution

A random variable X which is uniformly distributed between x_{min} and x_{max} has the PDF:

Summing independent uniformly distributed random variables

- Let X and Y be 2 independent uniformly distributed variables between $[0,1]$
- The random variable

$$Z = X + Y$$

- is not uniformly distributed

Summing independent uniformly distributed random variables

- Let X and Y be 2 independent uniformly distributed variables between $[0,1]$

$$Z = X + Y$$

10⁵ random samples of Z { `X=rand(1,1e5);`
`Y=rand(1,1e5);`
`Z=X+Y;`

Histogram of Z with normalized area { `[freqZ,cent]=hist(Z,100);`
`bin_width=(cent(100)-cent(1))/99;`
`area = sum(freqZ)*bin_width;`
`bar(centers,freqZ/area)`
`xlabel('z')`
`ylabel('F_Z(z)')`

Summing independent uniformly distributed random variables

- Let X and Y be 2 independent uniformly distributed variables between $[0,1]$

$$Z = X + Y$$

Summing a very large number of random variables

- Let X_1, \dots, X_{1000} be independent uniformly distributed variables between $[0,1]$

$$Z = \sum_{k=1}^{1000} X_k$$

Gaussian (Normal) Distribution

$$p_X(x) = \frac{1}{\sigma_X \sqrt{2\pi}} e^{-\frac{(x-m_X)^2}{2\sigma_X^2}}$$

Normal distribution

$$X \sim N(m_X, \sigma_X^2)$$

History of the Normal Distribution

From Wikipedia:

- The normal distribution was first introduced by **de Moivre** in an article in **1733** in the context of approximating certain binomial distributions for large n .
- His result was extended by **Laplace** in his book *Analytical Theory of Probabilities* (1812), and is now called the theorem of de Moivre-Laplace.
- Laplace** used the normal distribution in the analysis of errors of experiments.

History of the Normal Distribution

From Wikipedia:

- The important method of **least squares** was introduced by **Legendre** in 1805.
- Gauss**, who claimed to have used the method since 1794, justified it rigorously in 1809 by assuming a normal distribution of the errors.
- That the distribution is called the normal or Gaussian distribution is an instance of Stigler's law of eponymy: "No scientific discovery is named after its original discoverer."

Supplemental Material (You are not responsible for this...)

26

- Laplace transform of normal PDF
- Proof of the central limit theorem

Laplace transform of normal PDF

27

$$p_X(x) = \frac{1}{\sigma_X \sqrt{2\pi}} e^{-\frac{(x-m_X)^2}{2\sigma_X^2}}$$

$$P_X(s) = \int_{-\infty}^{\infty} e^{-sx} p_X(x) dx = \frac{1}{\sigma_X \sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-sx} e^{-\frac{(x-m_X)^2}{2\sigma_X^2}} dx$$

$$= \frac{1}{\sigma_X \sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-A(x)} dx$$

where, after “completing the squares”,

$$\begin{aligned} A(x) &= sx + \frac{x^2}{2\sigma_X^2} + \frac{m_X^2}{2\sigma_X^2} - \frac{2m_X x}{2\sigma_X^2} \\ &= \frac{1}{2\sigma_X^2} \left\{ [x + (s\sigma_X^2 - m_X)]^2 - s^2\sigma_X^4 + 2m_X s\sigma_X^2 \right\} \end{aligned}$$

Laplace transform of normal PDF

28

substituting,

$$P_X(s) = e^{(s^2\sigma_X^2/2) - sm_X} \underbrace{\int_{-\infty}^{\infty} \left\{ \frac{1}{\sqrt{2\pi}\sigma_X} e^{-(x+s\sigma_X^2-m_X)^2/2\sigma_X^2} \right\} dx}_{= 1 \text{ (area under a PDF = 1)}}$$

$$P_X(s) = e^{(s^2\sigma_X^2/2) - sm_X}$$

Fourier transform: $P_X(j\omega) = e^{\frac{-\omega^2\sigma_X^2}{2}} e^{-j\omega m_X}$

Proof of the central limit theorem

29

Let X_1, X_2, \dots be independent random variables each with mean m_X and variance σ_X^2 and define the sequence

$$Z_n = \frac{\sum_{k=1}^n (X_k - m_X)}{\sqrt{n}\sigma_X} = \sum_{k=1}^n \frac{Y_k}{\sqrt{n}}$$

where $Y_k = (X_k - m_X)/\sigma_X$

notice that

$$m_Y = E[Y_k] = 0 \quad \sigma_Y = E[Y_k^2] = 1$$

Proof of the central limit theorem

The moment generating function of Z_n is

$$\begin{aligned} P_{Z_n}(j\omega) &= E[e^{-j\omega Z_n}] = E\left[e^{-j\omega \sum_{k=1}^n \frac{Y_k}{\sqrt{n}}}\right] \\ &= \prod_{k=1}^n E\left[e^{-j\omega \frac{Y_k}{\sqrt{n}}}\right] \end{aligned}$$

by the Taylor series expansion of e^x

$$\begin{aligned} P_{Z_n}(j\omega) &= \prod_{k=1}^n E\left[1 - \frac{j\omega Y_k}{\sqrt{n}} - \frac{\omega^2 Y_k^2}{n} - \frac{j\omega^3 Y_k^3}{n^2} + \dots\right] \\ &\approx \prod_{k=1}^n \left(1 - \frac{\omega^2}{n}\right) = \left(1 - \frac{\omega^2}{n}\right)^n \end{aligned}$$

Proof of the central limit theorem

notice that, as $n \rightarrow \infty$ the approximation is exact

$$\lim_{n \rightarrow \infty} P_{Z_n}(j\omega) = \lim_{n \rightarrow \infty} \left(1 - \frac{\omega^2}{n}\right)^n$$

Moreover, the PDF and moment generating function of a normally distributed random variable $X \sim N(0, 1)$ are

$$p_X(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} \quad P_X(j\omega) = e^{-\frac{\omega^2}{2}}$$

$$\text{and} \quad P_X(j\omega) = e^{-\frac{\omega^2}{2}} = \lim_{n \rightarrow \infty} \left(1 - \frac{\omega^2}{n}\right)^n$$

Proof of the central limit theorem

Therefore, since

$$\lim_{n \rightarrow \infty} P_{Z_n}(j\omega) = \lim_{n \rightarrow \infty} \left(1 - \frac{\omega^2}{n}\right)^n = e^{-\frac{\omega^2}{2}}$$

Then, taking the inverse Fourier transform we obtain

$$\lim_{n \rightarrow \infty} p_{Z_n}(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$$

and

$$\lim_{n \rightarrow \infty} Z_n \sim N(0, 1)$$
